A sign of sustainability

Changes shape the awning fabric

Thank you for choosing a WAREMA product. Your awning is made exclusively from high-grade materials in premium quality.

Just as your garden will naturally change over time, so does the appearance of your awning fabric. Thanks to the high quality, this has no effect on the function and service life of your sun shading system. Find out more about production and use on the following pages.

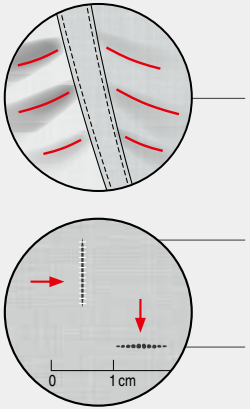

Weaving, cutting, sewing

Every WAREMA fabric is special

We manufacture our awning fabrics using state-of-the-art production facilities. Our weaving processes are fully quality-controlled, but there may still be minimal visual and tactile deviations in the material that do not affect the properties of the fabric.

Possible production-related occurrences

/ Wave formation in the seam and web area (due to thicker seams when rolling up the fabric)

/ Thread breaks or wrinkles (may occur during weaving due to tears in the warp or weft caused by high tension)

/ Thick spots may be created by fibre abrasion amassing in the weaving process.

/ Lint of different colours

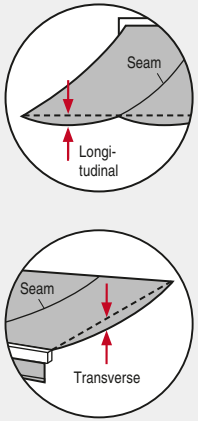

An exciting topic

What you need to know about your fabric

Our awning fabrics are kept taut through the interplay of various techniques. This creates the special aesthetic appearance that characterises a high-grade WAREMA awning. Your awning fabric is exposed to environmental influences such as rain, cold and heat, which can lead to changes in addition to the natural ageing process.

Cleaning instructions

- Awning fabrics must not be washed in the washing machine.
- Avoid heavy friction, e.g. from hard brushes or sponges.
- Awnings must not be cleaned using high pressure washers or unsuitable cleaning agents.

Possible occurrences

- Sagging in longitudinal or transverse direction due to own weight (especially for awnings of a large width)
- Slightly wavy side hems (due to ageing and temperature fluctuations)

Awning fabrics are similar to skin

Wrinkling over the course of time

Awning fabrics are similar to skin: wrinkles can form in particularly stressed areas - such as laughter lines. And just as with people, this depends on many factors. In short, even awning fabrics in a pergola or conservatory awning with SecuDrive® technology may wrinkle, and this cannot always be avoided. However, these are harmless and do not lead to any restrictions.

Harmless occurrences

- / Lateral waviness
- / Wrinkles
- / Slight waves

It rolls off

Protection for people and awnings

Our fabrics have a water-repellent impregnation that means light rain simply rolls off when the awning is set to the correct angle. To prevent damage however, we recommend retracting the fabric not only during storms, but also in the event of rain. If the fabric has become wet, the awning must be extended once again to avoid the formation of mould stains.

MADE IN GERMANY

High-tech awnings

Our awnings fulfil the highest technical quality requirements. They are manufactured on state-of-the-art production facilities and by hand by our specially trained employees.

Nevertheless, irregularities can occur during the manufacturing process or after many years of use, and this is something which you, as the awning owner, should be aware of. With the right care, you will be able to enjoy your awning for a long time.

Vibrant colours

How to clean and care for your awning fabric

6 steps to a clean awning fabric*

1. First remove any loose dirt from the dry awning fabric with a soft brush.
2. Thickly caked dirt particles will come off more easily if you wet the awning with clean water beforehand. You can best remove loosened dirt with a gentle stream of water from a garden hose.
3. Isolated streaks of dirt can be easily removed using a neutrally-coloured rubber eraser.
4. To remove deeper soiling or stains, it is best to use the Aclaris sun shading textile cleaner from WAREMA.
5. Then rinse the awning off using plenty of clean water.
6. Let the awning dry completely after treatment to prevent the growth of algae and mould. Then use the WAREMA Aclaris sun shading fabric impregnation to maintain the water and dirt-repellent properties of your awning.

*Claims for damages arising from the care instructions indicated above will not be honoured, since the effectiveness of these measures depends on a large number of factors that vary from case to case.

Clever sustainability

Replace fabric instead of buying a new awning

If your WAREMA awning fabric loses its protection against UV rays after many years or if the colours fade, you do not have to buy a completely new awning. We think and act in terms of sustainability. That means you can have your awning fabric replaced by your WAREMA specialised retailer. This not only saves costs, but also protects the environment and conserves valuable resources for future generations.
